

How To Increase CPU Utilization in Windows EC2 instance.

Step1: Create a launch Template

- Name: my-template
- AMI: Windows AMI
- Instance type: t3.micro
- Key: template

Step 2: Create Target Group (for load balancer)

Step 3: Create load balancer with created Target Group

Step 4: After creating,

1. launch Template
2. Target Group and 3. load balancer.

Now create an Auto Scaling Groups based on that.

Step 5: Give conditions like Average CPU Utilization, Time: 30seconds.

Now, after launching a Windows EC2 instance, connecting using **RDP(Remote Desktop)**.

Username: Administrator

Password: *** (from .pem key file).**

Commands used to increase **CPU Utilization in Windows:**

```
$cores = (Get-CimInstance  
Win32_Processor).NumberOfLogicalProcessors
```

```
PS C:\Windows\system32> $cores
```

```
2
```

```
PS C:\Windows\system32> $threads = (Get-CimInstance  
Win32_Processor).NumberOfLogicalProcessors
```

```
PS C:\Windows\system32>
```

```
PS C:\Windows\system32> # Spin up $threads background jobs doing math in a tight loop
```

```
PS C:\Windows\system32> 1..$threads | ForEach-Object {
```

```
>>   Start-Job -ScriptBlock {
```

```
>>     while ($true) {
```

```
>>       [Math]::Sqrt(123456) | Out-Null
```

```
>>     }
```

```
>>   }
```

```
>> }
```

Id	Name	PSJobTypeName	State	HasMoreData	
Location		Command			
--	----	-----	----	-----	-----
-					
1	Job1	BackgroundJob	Running	True	localhost
...					
3	Job3	BackgroundJob	Running	True	localhost
...					

```
PS C:\Windows\system32> # Show running jobs
```

```
PS C:\Windows\system32> Get-Job
```

Id	Name	PSJobTypeName	State	HasMoreData	
Location		Command			
--	----	-----	----	-----	-----
-					
1	Job1	BackgroundJob	Running	True	localhost
...					

3 Job3 BackgroundJob Running True localhost
...

#To stop the jobs running

PS C:\Windows\system32> **Get-Job | Remove-Job -Force**
